

Give Your Aging Metal Roof A Face Lift

Like everything in life, your metal building's roof is going to get tired, old and worn. It happens to them all. Over time, Mother Nature's destructive forces, long-term UV exposure and continuous expansion and contraction has left your metal roof rusty, leaking and deteriorating.

When this happens, it's time for a face-lift with a technically advanced, Stevens EP™ roofing membrane system. Stevens EP will provide your building with a fresh new look and help it give you many more years of service life.

Stevens EP brand of TPO is a durable, lightweight roofing system ideal for retrofitting tired, aging metal roofs including standing seam, flat seam, or corrugated deck types. Various membrane widths can accommodate 4-, 5-, and 6-foot purlin spacing.

In addition, with the Stevens EP Metal Retrofit Roofing System you gain valuable energy savings from both a new layer of insulation as well as from having an energy-efficient, reflective white roof installed.

Time for a Face Lift with Stevens EP!

Post-Op Check Up

A white, reflective, Stevens EP membrane meets the EPA Energy Star Roof Products Program guidelines for energy efficiency, and can help you reduce energy costs and save money!

Stevens EP membranes can be installed year-round, and are warranted for up to 20 years. In addition, Stevens EP has achieved Factory Mutual 1-90 wind uplift classification and is also available in eight architecturally pleasing colors. Perhaps that's why more than one-half billion square feet are already installed around the globe.

So do yourself – and your building – a big favor. Before you go with any roofing generalist, get a second opinion from the TPO experts at Stevens Roofing Systems.
